# Background subtraction by using scaling technique.

### Design for Background subtraction model by using FLASH

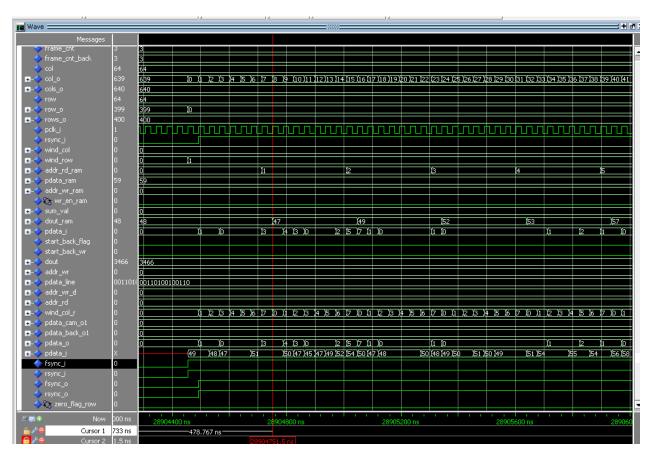

col_sub	: integer := 640;	cols total means 640 (640x400)
mem_limit	: integer :=640;	same as col 640
mem_limit_ram	: integer :=4095;	1 less than depth 4095
fram_back_sub	: integer :=2;	after how many frames background needs to be stored
fram_cam_sub	: integer :=3;	no need for this after how many frames came frame needs to be forward
fram_limit_sub	: integer :=3;	limit for frame count, after this reset to fram_cam_sub
width_sub	: integer:=14;	14 data size increase because of the summation for averaging.
depth_sub	: integer:=81;	81 col/8+1 for 8x8 8 elements of a row can scaled to one
addr_sub	: integer:=7;	7 how many bits to represent the depth in this 81
width_ram_sub	: integer:=8;	8For grayscale, after averging resultant value is 8 bits
depth_ram_sub	: integer:=4095;	4095 how many total locations (640/8)(400*/8)= 4000 bytes
addr_ram_sub	: integer:=12	12 how many bits to represent the depth in this 40000

In FLASH, we need to write 15 pages since we have (640/8 x400/8)=4000 which requires 4000/256= 15 pages. Presently clock frequency is 27 MHz but can be changes to a maximum of FLASH supported. Test bench has 18.5 ns for a clock period of 37 ns.

### **Flash erasing**

For Flash erasing from sector—page location 410100 use spi\_top\_module\_erase.bit and then press push button BTCN F5.

Note! FLASH writing only after each power up cycle. In middle, no control for writing.Power off is needed.

# **RTL simulation signals with FLASH writing once**

Please remember that during each background write in FLASH, the internal memory (BRAMs used for stored background) cannot be accessed for any other purposes.

In particular to our design, add\_rd\_ram should not be accessed from other processes during flash\_addr\_end\_o is 00 and 01 (the red marked portion). This is because the FLASH writing speed is slow. See FLASH we are using: Numonyx's N25Q128 datasheet:

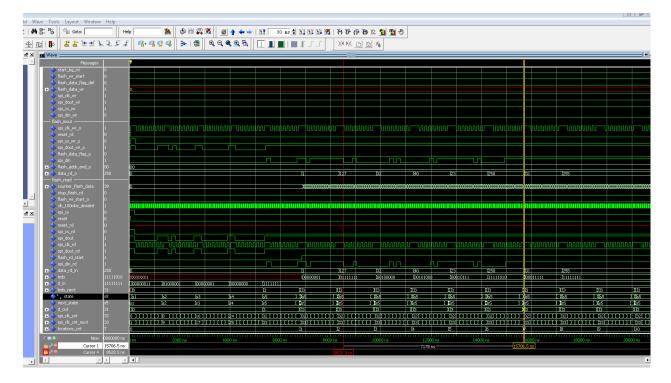

As soon as flash\_addr\_end\_o is 10, the BRAMs can be accessed for subtraction operation for next wake up and sleep cycles. flash\_addr\_end\_o shows that FLASH writing status.
