

# Analog Electronics, Short written exam 1 (2)

Mid Sweden University, Sundsvall 0711115, 8-10

Allowed accessories: Calculator, Any "pure" book of formulas – No textbook with solution allowed.

Preliminary grading

Unsatisfactory: <12

Satisfactory:  $\geq 12$

Good:  $\geq 16$

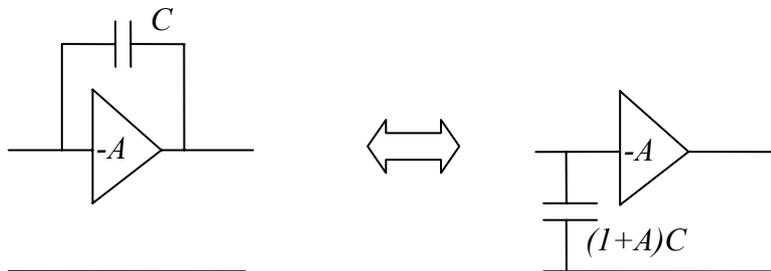

Very Good:  $\geq 20$

The solution should be clearly written and easy to follow. All assumptions should be written down. Bode diagrams should be carefully drawn asymptotically with a size of at least 5x10cm on squared paper.

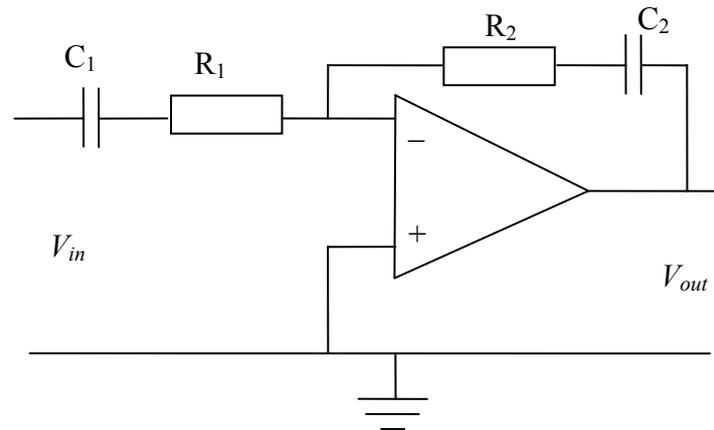

## 1. Questions

- What characterize an ideal Operational amplifier in terms of  $R_{in}$ ,  $R_{out}$ ,  $A_V$ ,  $I_{in}$ ,  $V_{in-diff}$ ? (2p)
- Use a Nyquist or a Bode diagram to show where an amplifier with open loop gain,  $A_{ol}$ , and feedback factor,  $\beta$ , is Unstable, Stable with  $<45^\circ$  phase margin, and Stable with  $>45^\circ$  phase margin. (2p)
- Which parameter are you focusing on to change (phase or gain) when using dominant pole compensation (1p)
- Which parameter are you focusing on to change (phase or gain) when using Lead compensation (1p)

- Derive the Miller theorem that says that a capacitance across an inverting amplifier act as an increased capacitor  $(1+A) \cdot C$  with respect the ground. (3p)

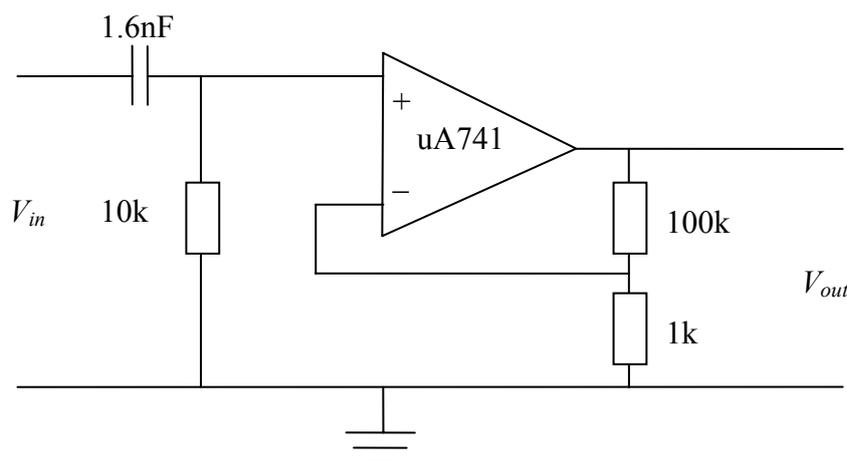

3. Derive an expression for the transfer function  $H(f)$  in Bodes normal form for the circuit below. (3p)

4. Draw a Bode diagram for the circuit in exercise 3 with both amplitude and phase of  $H(f)$  when  $R_1=1k\Omega$ ,  $C_1=1,6nF$ ,  $R_2=1k\Omega$ ,  $C_2=160nF$ . **If you did not solve exercise 3** you can draw the Bode diagram for the following transfer function **instead**.

$$H(f) = 10 \frac{\left(1 + j \frac{f}{10\text{Hz}}\right) \left(1 + j \frac{f}{10\text{kHz}}\right)}{j \frac{f}{100\text{Hz}} \left(1 + j \frac{f}{100\text{kHz}}\right) \left(1 + j \frac{f}{1\text{MHz}}\right)} \quad (3p)$$

5. The operational amplifier ua741 is connected according to the circuit below
- What is the lower cut-off frequency for the amplifier? (2p)
  - What are the upper cut-off frequency and the bandwidth for small signals for the amplifier? (2p)
  - Draw a Bode diagram for the amplifier with both amplitude and phase. (2p)
  - Calculate how large signals that can be fed to the amplifier without distorting the output by the slew-rate at the upper cut off frequency? (3p)

Good Luck  
/Kent

- Short-Circuit Protection
- Offset-Voltage Null Capability
- Large Common-Mode and Differential Voltage Ranges
- No Frequency Compensation Required
- Low Power Consumption
- No Latch-Up
- Designed to Be Interchangeable With Fairchild μA741

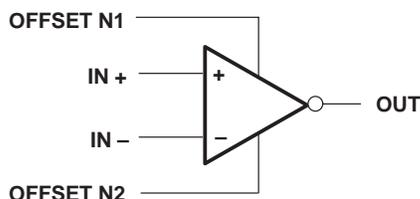

### description

The μA741 is a general-purpose operational amplifier featuring offset-voltage null capability.

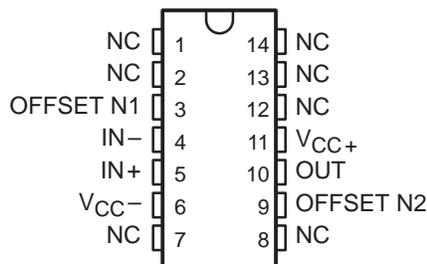

The high common-mode input voltage range and the absence of latch-up make the amplifier ideal for voltage-follower applications. The device is short-circuit protected and the internal frequency compensation ensures stability without external components. A low value potentiometer may be connected between the offset null inputs to null out the offset voltage as shown in Figure 2.

The μA741C is characterized for operation from 0°C to 70°C. The μA741I is characterized for operation from -40°C to 85°C. The μA741M is characterized for operation over the full military temperature range of -55°C to 125°C.

Resistors	11
Diode	1
Capacitor	1

**μA741Y chip information**

This chip, when properly assembled, displays characteristics similar to the μA741C. Thermal compression or ultrasonic bonding may be used on the doped-aluminum bonding pads. Chips may be mounted with conductive epoxy or a gold-silicon preform.

# $\mu$ A741, $\mu$ A741Y GENERAL-PURPOSE OPERATIONAL AMPLIFIERS

SLOS094B – NOVEMBER 1970 – REVISED SEPTEMBER 2000

## absolute maximum ratings over operating free-air temperature range (unless otherwise noted)<sup>†</sup>

	$\mu$ A741C	$\mu$ A741I	$\mu$ A741M	UNIT
Supply voltage, $V_{CC+}$ (see Note 1)	18	22	22	V
Supply voltage, $V_{CC-}$ (see Note 1)	-18	-22	-22	V
Differential input voltage, $V_{ID}$ (see Note 2)	$\pm 15$	$\pm 30$	$\pm 30$	V
Input voltage, $V_I$ any input (see Notes 1 and 3)	$\pm 15$	$\pm 15$	$\pm 15$	V
Voltage between offset null (either OFFSET N1 or OFFSET N2) and $V_{CC-}$	$\pm 15$	$\pm 0.5$	$\pm 0.5$	V
Duration of output short circuit (see Note 4)	unlimited	unlimited	unlimited	
Continuous total power dissipation	See Dissipation Rating Table			
Operating free-air temperature range, $T_A$	0 to 70	-40 to 85	-55 to 125	$^{\circ}$ C
Storage temperature range	-65 to 150	-65 to 150	-65 to 150	$^{\circ}$ C
Case temperature for 60 seconds	FK package		260	$^{\circ}$ C
Lead temperature 1,6 mm (1/16 inch) from case for 60 seconds	J, JG, or U package		300	$^{\circ}$ C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	D, P, or PW package		260	$^{\circ}$ C

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. All voltage values, unless otherwise noted, are with respect to the midpoint between  $V_{CC+}$  and  $V_{CC-}$ .  
 2. Differential voltages are at  $IN+$  with respect to  $IN-$ .  
 3. The magnitude of the input voltage must never exceed the magnitude of the supply voltage or 15 V, whichever is less.  
 4. The output may be shorted to ground or either power supply. For the  $\mu$ A741M only, the unlimited duration of the short circuit applies at (or below) 125 $^{\circ}$ C case temperature or 75 $^{\circ}$ C free-air temperature.

DISSIPATION RATING TABLE
